Washington: 1975

Foreword

THIS REPORT is the second in a series of publications begun with data for 1966 to disseminate annual information on the utilization of short-stay hospitals by Medicare beneficiaries. It provides detailed figures for calendar year 1967 on the number and rate of discharges and days of care, average length of stay, hospital charges, amounts reimbursed under the program, and the number of persons with multiple hospital stays during the year. Selected utilization measures and reimbursement data are shown by age, race, and sex of Medicare beneficiaries; by their place of residence; and by the characteristics of the hospitals used such as type of control, bed size, accreditation status, etc.

The figures relate to discharges from short-stay hospitals that occurred in 1967, the first full year of operation of the Medicare program. As such, they provide baseline data for measuring trends in utilization of short-stay hospitals under Medicare as program experience evolves.

Many individuals in the Social Security Administration have assisted with the development of this se-

ries. The preparation of these reports is a major function of the ORS Division of Health Insurance Studies, under the supervision of Howard West, director, and Aaron Krute, deputy director, Program Statistics. Important contributions for the tabulation and presentation of the statistical content of this report were made by Irving Goldstein and Robert J. Butler of the Statistical Processing Branch of the Division. The estimates of statistical reliability were prepared for publication by Nathaniel M. Pigman, Jr., and James C. Beebe of the Mathematical Statistical Group of the Division. Text preparation was the responsibility of Marian Gornick of Program Statistics. Special acknowledgment for computer services are made to the Division of Health Insurance Statistical Data, Bureau of Data Processing.

The general tables were produced by the "System for Automated Tabular Composition," a computer system, at the Social Security Administration headquarters in Baltimore, Maryland. They were set on Linotron equipment at the Government Printing Office.

John J. Carroll Assistant Commissioner for Research and Statistics

	reimbursement for patients with surgery and without surgery	4.1–56

THIS PUBLICATION is a section of a statistical report series produced from Medicare program records. Presented on a calendar year basis, describing services rendered in the year, the series includes sections on enrollment, characteristics of providers, inpatient care in hospitals and extended care facilities, outpatient hospital services, home health services, physicians' and other medical services, and overall summaries.

The primary objective of these reports is to provide data required to measure and evaluate program operation and effectiveness. Benefit payment operations furnish information about the amount and kind of hospital and medical care services used by persons aged 65 and over, as well as the expenditures for such services. The applications by hospitals, extended care facilities, home health agencies, and independent laboratories to participate in the program provide data on the characteristics of such providers of services. The claim number assigned to each individual serves as the link between the program services utilized and the demographic characteristics of each individual recorded in the health insurance entitlement master file.

The data-collection system has two inherent characteristics that determine the scope, detail, and flexibility of the available data. First, data are collected and maintained on an individual basis so that the beneficiary and his medical experience under the program form the basic unit. Second, records for each bill paid under the program and, for a sample of beneficiaries, records of diagnoses and surgical procedures are maintained on a centralized basis. Except for intermediary operating statistics such as those relating to workloads, costs, and the like, all program statistics are centrally prepared.

THE BASIC RECORDS

The statistical system is based on five related computer-tape records: the health insurance entitlement master file, provider record, hospital insurance (Part A) utilization record, medical insurance (Part B) payment record, and the record containing information from medical insurance bills for a 5-percent sample of supplementary medical insurance enrollees.

THE HEALTH INSURANCE ENTITLEMENT MASTER FILE

The health insurance entitlement master file identifies each aged person eligible for health insurance benefits and indicates whether he is entitled to hospital benefits, to supplementary medical insurance benefits, or to both of these benefits.

This record is used to create a health insurance card that is sent to each insured person. The card contains the individual's claim number (the number used for OASDI or railroad retirement programs). It indicates the entitlement of the individual for the two parts of the Medicare program.

The entitlement record provides the population data for each part of the program and therefore serves as the base for the computation of a variety of utilization rates, limited only by its demographic content.

PROVIDER RECORD

Every hospital, home health agency, extended care facility, and independent laboratory must apply for participation in the hospital insurance program in order to be reimbursed for services provided. Data included on the application forms have been recorded in the central provider record and are updated as facilities are recertified periodically, as new ones apply for participation, or as some leave the program. When the information in this provider file is combined with utilization data, it serves to relate the characteristics of facilities and agencies that provide care to the kinds and amounts of service used by persons insured under Medicare.

UTILIZATION RECORD FOR HOSPITAL INSURANCE

The administration of the hospital insurance program requires that two items of information be known about each person at the time of his admission to a hospital—his entitlement under the program and the extent to which he has used the benefits available to him under the "benefit period" concept.

When the patient is admitted to a hospital, the admission section of the inpatient hospital admission and billing form is completed by the hospital and forwarded through its intermediary to the Social Security Administration for recording in the central record. As soon as the record is checked, normally in less than 24 hours, the intermediary is informed of the patient's benefit status and of the number of days remaining during the "benefit period."

This information is then forwarded to the hospital. At discharge, the hospital completes the billing section of the form and sends it to the intermediary for payment. When approval for payment has been made, the intermediary forwards the claim to the Social Se-

of the Medicare Program

curity Administration for inclusion in the central record.

As part of this process, information on diagnoses and surgical procedures are coded for a 20-percent sample of beneficiaries based on specific combinations of digits in the health insurance claim number. Copies of admission and billing forms are handled in a comparable manner by home health agencies and extended care facilities. The outpatient billing form is also transmitted to the Social Security Administration for recording in the central record after the bill is approved for payment by the intermediary.

All the information on utilization experience in hospital and extended care facilities that is needed to administer the "benefit period" provision is recorded in the central record. This information includes stays in certain nonparticipating institutions that meet the definition of a hospital or extended care facility under the law, and days of care not covered or reimbursable under the program.

Each admission and billing form contains both the beneficiary's claim number and the provider's identification number. The resulting tape record can be readily matched to the beneficiary files and the provider files. By this process, a statistical tape record is created for the sample of insured persons that contains all the available information needed for tabulation from the three files related to Part A utilization.

PAYMENT FOR MEDICAL INSURANCE

Payment or reimbursement under the SMI program is made only after receipt by the carriers (intermediaries involved in Part B of the Medicare program) of bills having allowed charges exceeding \$50 during a calendar year period.

For the insured population, carriers need to know from a central source that the deductible has been met; thereafter, during the remainder of the calendar year, the only additional information required from the Social Security Administration for reimbursement or payment purposes is whether the person is still enrolled under the SMI program.

For administration and operation of the program, the Social Security Administration must have accurate and complete information on the amounts paid by the carriers for physician services and for other services and supplies under this part of the program. To meet these needs, carriers furnish a payment record consisting of tape, punched card, or other machine-readable record of each bill paid. A "bill" is defined as a request for payment from or on behalf of a beneficiary as the result of services provided by a

single physician or supplier.

The payment record also contains selected items of information needed to supply an efficient basis for drawing samples of the bills. These items provide a sampling frame that may be used to draw additional samples designed to obtain specific information not furnished reliably by the basic sample of enrolled persons under the medical insurance program.

THE MEDICAL INSURANCE SAMPLE

Although the payment record provides a rapid method for summarizing payment data and a sampling frame for efficiently drawing additional samples of bills, it does not provide specific data on diagnoses, procedures, and related charges.

Basic statistics on the utilization of physician and other services covered under the supplementary medical insurance program are derived from bills paid by intermediaries to or on behalf of a continuous 5-percent sample of all enrolled persons. Intermediaries have been given specific combinations of digits of the health insurance claim number to be used in selecting the 5-percent sample, which is a sub-sample of the 20-percent sample used for hospital insurance program data.

Bills are submitted either directly on an SSA request for payment form, or on the SSA form in combination with the physician's billing form. Both methods are designed to provide information on the date and place of each service, the procedure carried out or service provided, the condition treated (diagnosis), and the physician's or supplier's charge for the specific service.

All of the bills of persons in the 5-percent sample to or for whom payment is made under the program, including those used to meet the annual \$50 deductible, are included in the sample and coded. However, data are not available through these procedures for persons in the sample who do not meet the \$50 deductible. Such data are collected by means of the Current Medicare Survey, with data made available in a separate report series.¹

For hospital-based physicians who have authorized the provider to collect the fee for their services, the provider billing for patient services by physicians form is used. This form is completed for each patient. It includes descriptive information on the date and place of each service, the diagnoses, procedures, and the charges. These bills are received centrally for the 5-percent sample of persons enrolled for supplementary medical insurance.

Short-Stay Hospital Utilization, 1967

Summary

DURING 1967, the first full calendar year of the Medicare program, 3.6 million persons—18 percent of all those ever enrolled in the hospital insurance (HI) program at any time during the year—received inpatient hospital services in short-stay hospitals and were discharged by December 31, 1967. Of these 3.6 million persons, 75 percent had one hospital stay only that year while the remaining 25 percent had two stays or more. In total, these persons accounted for 5.1 million hospital episodes in 1967.

This report presents tabulations of various measures of utilization and charges for these 5.1 million discharges according to selected beneficiary characteristics—including age, sex, race, area of residence, and surgical and discharge status of persons served. Discharges are also tabulated according to type of hospital control and bed size. A subsequent report will describe utilization for specific discharge diagnoses and selected surgical procedures. A summary of the major findings from this report follows.

The 5.1 million discharges occurring in 1967 accounted for 69.7 million days of short-stay hospital care. Annual rates of utilization for 1967 were 259 discharges and 3,575 days of care per 1,000 HI enrollees. The mean length of stay per discharge was 13.8 days. Of the total 69.7 million days of care, the great majority—66.2 million days or 95.0 percent—were covered days, i.e., paid for in full or in part by the HI program.

Total hospital charges for short-stay discharges in 1967 were \$3.4 billion. Medicare patients were responsible for \$0.3 billion or 9.7 percent in nonreimbursable charges (deductibles, coinsurance, and other noncovered services) for hospital episodes paid for in full or in part by the HI program. HI enrollees were also responsible for an additional amount—estimated at 1 percent of total charges—for hospital stays for which there was no reimbursement under the program. HI payments shown in this report represent interim reimbursements made by the Medicare program of \$2.7

billion or 78.3 percent of total hospital charges. Available audited cost reports for 1967 indicate additional payments were made of approximately 5 percent over the amounts paid on an interim basis. Average hospital charges were \$49 per day of care (including room, board, and ancillary charges) and \$675 per discharge.

The 1.6 million hospitalizations that involved surgical services—31.8 percent of total discharges—were associated with longer stays and higher charges. The mean length of stay for discharges with surgery was 15.2 days. For those discharges without surgery, the mean was 13.1 days. Average hospital charges for discharges with surgery were \$57 per day and \$867 per discharge. For those without surgery average charges were \$45 per day and \$585 per discharge. For all discharges, both with and without surgery, the mean charge per day decreased as the length of stay increased. This trend is primarily attributed to the fact that many ancillary service charges are incurred in the first few days of the hospital stay (e.g., operating room charge). As the length of stay increases these charges represent a smaller proportion of average charges per day.

More variation in short-stay hospital utilization was found by age than by sex or race. Discharge rates and length of stay increased significantly with advancing age. Discharge rates rose from 212.5 per 1,000 enrollees aged 67–68 years to 370.1 for those aged 85 years and over—a 74 percent increase. The annual rate of days of care more than doubled between these same two age groups—2,657 days per 1,000 enrollees 67–68 years of age and 5,891 days per 1,000 enrollees 85 years and over, reflecting the increase in average length of stay which rose more than 3 days, from 12.5 days for enrollees 67–68 years to 15.9 days for those 85 years of age and over.

Patterns of hospital utilization were different for men and women. Men had more hospitalizations although of a shorter duration. The discharge rate for men was 15 percent greater than that for women280.2 and 244.0 discharges per 1,000 enrolled, respectively. Differences in discharge rates for men and women generally prevailed for every age group. Although the discharge rate for men was 15 percent greater than for women, the annual rate of days of care for men (3,713 days per 1,000 enrolled) exceeded that for women (3,473 days per 1,000) by only 7 percent, reflecting the fact that men averaged stays nearly 1 day less than that for women—13.3 days for men and 14.2 days for women.

Similar to the offsetting pattern found by sex, white persons—compared to those of other races—had more hospitalizations although of a shorter duration. However, the differences by race were much greater than by sex. The discharge rate for white persons, 265.5 discharges per 1,000, exceeded that for persons of all other races, 189.4 discharges per 1,000, by 40 percent. This differential by race generally held by sex and age groups within race. The annual rate of days of care for white persons (3,622 days per 1,000) exceeded that for persons of all other races (2,828 days per 1,000) by 28 percent, this smaller differential reflecting the fact that white persons had stays averaging 1.3 days less—13.6 days for white persons compared to 14.9 days for persons of all other races.

Average hospital charges per day for Medicare beneficiaries decreased with advancing age, reflecting the longer stays experienced by each successive age group. Average charges per stay followed a pattern of rising very slowly with advancing years. Variations in average charge per day and per discharge were relatively small by sex and race.

Geographic variations in the use of short-stay hospitals were very marked. There were substantial differences by census region and division in discharge rates, average length of stay, and average number of days of care per 1,000 enrollees. Of the four U.S. census regions, the South had the highest discharge rate, 283 discharges per 1,000 enrolled persons or 8 percent above the national average. In contrast, the Northeast region, with the lowest discharge rate-217 discharges per 1,000—registered 17 percent below the national figure. Among the nine U.S. census divisions, Medicare beneficiaries in the Mountain division had a discharge rate 23 percent higher than the U.S. average while beneficiaries in the Middle Atlantic division were discharged at a rate 20 percent lower than the national figure.

Length of stay in the census regions ranged from an average 16.1 days for a hospital episode or 17 percent above the national average in the Northeast region down to an average of 11.8 days in the West or 14 percent lower than the U.S. figure. Among the divisions, Medicare patients in the Middle Atlantic division had hospitalizations averaging 16.5 days whereas in the West South Central division the average length of stay was 11.1 days.

Although there were considerable geographic differences in the average number of days of care per 1,000 enrollees, this measure of utilization varied less than the discharge rate or the mean length of stay. The

North Central region had the highest rate of days of care, 4,052 days of care per 1,000 enrolled persons or 12 percent above the national average whereas the rate for the West was 3,151 days of care per 1,000 persons enrolled or 13 percent below the U.S. average. Among the divisions, the numbers of days of care per 1,000 ranged from a high of 18 percent above the mean in the West North Central division to a low of 19 percent below average in the Pacific division.

Geographic variations in hospital charges were substantial. Average hospital charges in the regions ranged from \$60 per day in the West to \$43 per day in the South; hospital charges per discharge averaged \$884 in the Northeast or 31 percent above the national average whereas hospital charges per discharge averaged \$531 in the South or 22 percent lower than the U.S. figure.

Source and Qualifications of the Data

The data in this report were derived from bills for inpatient services submitted by short-stay hospitals for a 20-percent sample of the insured population. When a beneficiary is admitted to a hospital, the hospital sends a notice of admission which is ultimately recorded in Social Security Administration files. Similarly, the hospital bills are also recorded in these files. Upon receipt of a discharge bill, a discharge record is created consolidating information about the hospitalization. The discharge record can consist of one or more bills depending on the length of stay and hospital billing procedures.

Information from the billing form is matched to the "Health Insurance Entitlement" file, which identifies all persons eligible for Medicare benefits and includes demographic information about each person. The bill data are also matched to the master "Provider of Services" file maintained by the Social Security Administration. This file contains detailed information about the characteristics of each short-stay hospital participating under Medicare. The final set of records, consisting of bill data, demographic information about the person hospitalized, and characteristics of the hospital, is then used in the preparation of tabulations included in this report.

The 20-percent sample on which the data in this report are based includes bills for all persons whose HI claim number ends in certain preselected numerical digits. The published data are inflated estimates derived from the sample counts. The estimates are prepared using a ratio-estimation weighting technique that is described in "Reliability of Estimates" shown elsewhere in this report.

There is a lag between the time a person is discharged from a hospital and the time this discharge is posted to Social Security Administration records.

¹ For more detailed information about bill records and files see "The Statistical System of the Medicare Program."

The processing time for most discharges is comparatively short. However, the time lag increases for claims involving special problems. The data in this report include all discharges from short-stay hospitals during the period January-December 1967 that were received and recorded as of January 5, 1972. It is estimated that over 99 percent of the 1967 shortstay hospital discharges were included in this publication file.

Rates shown in this report are based on the July 1, 1967 HI enrollment.2 Prior to the computation of rates reported here a study was made of 1967 HI enrollment data. Comparison of mid-year enrollment data recorded for July 1, 1967, by age, race, and sex with corresponding 12-month averages for 1967 showed differences averaging only 0.1 percent.

Payments under the HI program shown in this report reflect reimbursements based on interim rates, usually established as a per diem amount or on percentages of total charges. The final amount due each provider of medical services is determined after the end of his fiscal year on the basis of his audited, reasonable costs of operation. Available audited cost reports for 1967 indicate additional payments were made of about 5 percent over the amounts paid on an interim basis.

Changes in the residence of beneficiaries are recorded as they are reported in health insurance eligibility files. The State of residence for each discharge reflects the residence information in the eligibility file at the time the hospital discharge record was matched to it.

Number and Rate of Discharges

The period covered by this report, January 1-December 31, 1967, was the first full calendar year of the Medicare program. On July 1, 1967, the mid-point of the year, there were 19.5 million persons aged 65 and over enrolled for hospital insurance (HI) benefits. Medicare data for 1967 show that of all inpatient hospital stays, more than 97 percent occurred in shortstay hospitals, defined under the program as general and special hospitals reporting average stays of 30 days or less.

This report presents data on short-stay hospital care provided to Medicare beneficiaries in 1967. During the year, 3.6 million persons were hospitalized in short-stay hospitals and discharged by December 31, 1967. Among the aged, multiple hospitalizations during one year are frequent. Of the 3.6 million persons hospitalized, 75 percent had one hospital stay only in 1967 while the remaining 25 percent had two stays or more. Overall, they accounted for 5,055,000 discharges from short-stay hospitals in 1967, giving an annual rate of 259.3 discharges per 1,000 enrolled persons.3

AGE, RACE, SEX

Of the three demographic characteristics studied in the utilization of hospital services—age, race, and sex -variations by age were most marked. The annual rate of discharges increased sharply with age, from 212.5 discharges per 1,000 enrolled at ages 67-68 to 370.1 discharges per 1,000 enrollees aged 85 and over —a 74 percent increase. The number of discharges recorded for men totaled 2.3 million compared to 2.7 million for women. However, discharge rates were 15 percent higher for men than for women. The rate for men was 280.2 per 1,000 enrollees and for women, 244.0 per 1,000. Rates were consistently higher for men for each age group (table A).

White persons accounted for 4.6 million or 91.3 percent of all short-stay discharges (table 4.1.2) and persons of all other races for 283,000 discharges or 5.6 percent of the total. The remaining 156,000 were discharges of persons whose race was unknown. 5 Discharge rates for short-stay hospitals averaged 40 percent greater for white persons (265.5 discharges per 1,000) than for persons of all other races (189.4). The differences in these rates between the two race groups were generally observed for both sexes and for most age groups. One notable exception was among men of other races in the youngest age group, 65-66 years, whose discharge rate, 212.2 discharges per 1,000, was relatively high and nearly equalled that for white men of the same age group, 224.7 (figure 1). Relationships between races by sex and age (derived from table A) are shown below.

Age	Ratio of rate for white persons to rate for persons of other races			
	Men	Women		
65 years and over	1.35	1.46		
5-66	1.06	1.51		
7–68	1.28	1.35		
9–70	1.38	1.38		
1–72	1.47	1.40		
3-74	1.43	1.43		
5–79	1.44	1.45		
-84	1.33	1.49		
and over	1.39	1.55		

³ Various studies have been undertaken to assess the initial impact of Medicare on hospital utilization. Estimates of the inimpact of Medicare on hospital utilization. Estimates of the increase in the short-stay hospital discharge rate for persons 65 years of age and over from the year before to the year after Medicare have been reported in the range of 4.6 to 7.4 percent. See Julian Pettengill "Trends in Hospital Use by the Aged," Social Security Bulletin, Vol. 35, p. 3, July 1972.

⁴ Persons aged 67–68 are used as the basis for comparison since all persons aged 65–66 were not entitled to covered services for the entire year.

⁵ There were approximately 613 000 persons of unknown race.

There were approximately 613,000 persons of unknown race enrolled in the HI program as of July 1, 1967. For a description of the 1967 Medicare enrollment see Social Security Administration, Office of Research and Statistics, Medicare: Health Insurance for the Aged, 1967, Section 2: Persons Enrolled in the Health Insurance Program (Washington, D.C.: U.S. Covernment Printing Office, 1972) U.S. Government Printing Office, 1972)

² For a description of the 1967 enrolled population see Social Security Administration, Office of Research and Statistics, Medicare: Health Insurance for the Aged, 1967, Section 2: Persons Enrolled in the Health Insurance Program (Washington, D.C.: U.S. Government Printing Office, 1972)

¹ Rate for men to rate for women.

Overall, surgery was performed in 31.8 percent of all hospitalizations (table 4.1.2). For men, the proportion of discharges that involved surgery was higher than that for women—34.0 percent compared to 30.1 percent, respectively. Similarly, the proportion of discharges for white persons that involved surgery, 32.0 percent, was greater than the corresponding proportion for persons of all other races, 29.9 percent. The percentage of discharges with surgery declined steadily with age from 36.8 at ages 67–68 to 22.5 at ages 85 years and over. The decline of surgery with age held true for each race group and by sex within race.

Of all discharges, 9.8 percent ended with the death of the patient. The proportion of such discharges increased sharply with age, rising from 6.7 percent of all discharges at ages 67–68 to 17.3 percent at ages 85 and over. The proportion of surgical discharges that ended with the death of the patient was only 5.3 percent compared with 12.0 percent for nonsurgical discharges. As may be observed below, the proportion discharged dead—with or without surgery—increased consistently with age.

Age	Percentages of discharges ending with the death of the patient					
_	Total	With surgery	Without surgery			
All ages	9.8	5.3	12.0			
65–66	6.1	3.1	7.9			
67–68	6.7	3.8	8.4			
39–70	7.3	4.0	9.1			
71–72	8.0	4.2	10.0			
73–74	8.9	4.7	11.0			
75–79	10.5	5.8	12.5			
30–84	13.1	7.7	15.1			
35 and over	17.3	11.7	19.0			

Operative procedures defined as surgery in Current Procedural Terminology, First Edition, published by the American Medical Association in 1966 include procedures, involving incision, excision, amputation, introduction, endoscopy, repair, destruction, suture, or manipulation.

The proportion of discharges ending with the death of the patient was greater for men than for women—11.3 and 8.6 percent, respectively. Persons of other races also had a higher proportion of discharges that ended with the death of the patient compared with white persons, 12.2 and 9.6 percent, respectively. These differences found by sex and race also held true for surgical and nonsurgical discharges (table 4.1.4).

GEOGRAPHIC DISTRIBUTION

Geographic variations in discharge rates were quite marked. Among the four regions, the South had the highest discharge rate, 282.9 discharges per 1,000 enrollees or 8 percent above the national average. The lowest rate was in the Northeast region, 217.4 per 1,000 or 17 percent below the United States figure. Utilization rates can vary among geographic regions simply because their populations differ according to age, race, sex or other demographic characteristics that affect the use of inpatient hospital services. The South, for example, had the highest proportion of HI enrollees of races other than white.7 Accordingly, the discharge rates in the United States and the four regions were standardized by age, race, and sex by the "indirect method," s using "all areas" as the standard population. The crude discharge rates and the standardized discharge rates for persons of known race in the United States and the four regions were:

Region	Crude rate	Ratio ¹	Standard- ized rate	Ratio ¹
United States Northeast North Central South West	261.7	1.00	262.4	1.00
	217.4	.83	216.2	.82
	276.6	1.06	272.1	1.04
	282.9	1.08	291.1	1.11
	267.7	1.02	265.7	1.01

¹ Ratio of regional to United States rate.

⁷ Medicare: Health Insurance for the Aged, 1967, Section 2: Persons Enrolled in the Health Insurance Program, op. cit.

⁸ Mortimer Spiegelman, Introduction to Demography (Cambridge: Harvard University Press, 1968), pp. 102-6.

With the exception of the South, a comparison of the crude rate and the standardized rate shows relatively little change. The crude rate for the South was adjusted nearly 3 percent from 282.9 to 291.1. This is explained by the fact that the South's crude rate is heavily weighted by that region's greater than average proportion of HI enrollees of races other than white, 15.8 percent, whose discharge rate was lower than that for white persons (table A). When the South's crude discharge rate was adjusted to reflect the proportion of persons of races other than white among all HI enrollees, 7.7 percent, its standardized rate increased. However, it may be observed in the above table that the corresponding ratios for each region—crude and standardized—showed relatively small differences and, moreover, the rank order of the regions remained constant.

Considerably more variation was found in the nine census divisions, the rates ranging from a high of 321.5 discharges per 1,000 enrolled persons in the Mountain division or 23 percent above the national average to a low of 209.1 per 1,000 or 20 percent below the United States figure in the Middle Atlantic division.

			Ratio
All areas	5,055	259.3	
United States	5,022	261.7	1.00
Northeast	1,105	217.4	.83

West South Central	537	312.1	1.19
West	775	267.7	1.02
Mountain	207	321.5	1.23
Pacific	568	252.3	.96

¹ Ratio of rate in the geographic area to the United States mean.

Variations by State in the discharge rate were more than two-fold. There were six States with discharge rates above 350 per 1,000 enrollees—Montana (416.0), Colorado (362.5), Wyoming (381.8), North Dakota (417.7), South Dakota (389.5), and Oklahoma (352.8). In contrast, discharge rates below 200 per 1,000 were observed in New Jersey (193.7), Maryland (198.4), and the District of Columbia (197.1). The rates for Delaware (200.4) and New York (202.9) were only slightly higher (table 4.1.1).

Patterns of care differed geographically relative to the percentage of discharges with surgery and the percentage of discharges ending with the death of the patient. As summarized below, the South, with the highest discharge rate, had the lowest percentage of discharges with surgery and next to the lowest percentage of discharges that ended with the death of the patient. The Northeast, with the lowest discharge rate, had the highest percentage of discharges with surgery and the highest percentage that ended with the death of the patient.

The Spearman rank-correlation coefficient showed an inverse relationship in the divisions between the discharge rate and the percentage of discharges with surgery. This test also showed an inverse relationship in the divisions between the discharge rate and the percentage of discharges ending with the death of the patient. These findings suggest that differences in the discharge rate, by division, may reflect, in part, differences in the degree of illness of patients admitted for inpatient services.

Geographic division	Percent of discharges with surgery	Percent of discharges ending with the death of the patient
All areas	31.8	9.8
United States	31.9	9.9
Northeast	36.1	11.9

South Atlantic	31.5	9.6
East South Central	24.6	8.8
West South Central	25.3	7.5
West	34.4	8.5
Mountain	30.7	7.9
Pacific	35.7	8.7

HOSPITAL CHARACTERISTICS

Of the total 5.1 million discharges from short-stay hospitals, approximately 71 percent were from voluntary hospitals (27 percent from voluntary-church controlled hospitals and 44 percent from other voluntary hospitals), 21 percent from government-controlled hospitals other than Federal, and the remaining 8 percent from hospitals under proprietary control. Discharges for HI enrollees, by hospital control, were generally proportional to the distribution of adult beds, as shown below:

Percent	Number	Percent
100.0	779,908	100.0
70.8	528,541	67.8
26.9		_
43.9	_	
21.2	197,278	25.3
8.0	54,089	6.9
	70.8 26.9 43.9 21.2	70.8 528,541 26.9 — 43.9 — 21.2 197,278

¹ For a description of the 1967 Medicare hospitals, see Social Security Administration, Office of Research and Statistics, Medicare: Health Insurance for the Aged, 1967, Section 3.1: Participating Hospitals (Washington, D.C.: U.S. Government Printing Office, 1972)

For selected definitions and explanations of terms used in this report, see Notes preceding the General Tables at the end

of this report.

As shown above, voluntary hospitals accounted for a slightly greater proportion of discharges than of adult beds, while government hospitals had a larger percentage of beds than discharges.

Nearly 30 percent of all short-stay hospital discharges were from hospitals with less than 100 beds, 60 percent from hospitals with 100–499 beds, and 10 percent from hospitals with 500 beds or more. As shown below, small hospitals (less than 100 beds) accounted for more Medicare discharges and large hospitals (500 or more beds) accounted for less Medicare discharges compared with their proportion of adult beds.

	Disch	arges	Adult beds ¹			
Hospital bed size	Number (in thou- sands)	Percent	Number	Percent		
All hospitals Less than 100 beds 100-299 300-499 500 beds or more	1,466 2,084 978	100.0 29.0 41.2 19.4 10.4	779,908 182,498 311,963 156,762 128.685	100.0 23.4 40.0 20.1 16.5		

¹ Number of beds by bed size estimated from SSA data as of July 1967.

In contrast to the overall distribution of discharges by bed size shown above, nearly 70 percent of all Medicare discharges from proprietary hospitals were from those with fewer than 100 beds (table 4.1.5). Discharges from hospitals under government control show a higher than average proportion from both very small and very large hospitals—about 45 percent were from hospitals with fewer than 100 beds and 14 percent were from hospitals with 500 beds or more.

The frequency of surgical procedures varied considerably by type of hospital control and bed size. Overall, surgery was performed in 31.8 percent of all discharges. This proportion was highest in voluntary hospitals—nearly 35 percent. For hospitals under proprietary and government control this proportion was 24 percent. As shown in the table below the proportion of discharges with surgery increased considerably with bed size for hospitals under every type of control except for the largest hospitals under proprietary and government control.

Average Length of Stay

The mean length of stay for HI enrollees discharged from short-stay hospitals in 1967 was 13.8 days. 10 Approximately 1 out of 10 hospital episodes ended with the death of the patient. Although the mean length of stay for hospitalizations in which the patient died was nearly equal to that for patients discharged alive, 13.9 and 13.8 days, respectively, the distribution of discharges by length of stay intervals varied markedly according to discharge status (figure 2). A large proportion of patients discharged dead had short hospitalizations. Twenty percent of all discharges that ended with the death of the patient were stays of 1 day or less; 50 percent were stays of 8.1 days or less. In contrast, for those discharged alive, only 2.9 percent were stays of 1 day or less; the median length of such stays was 10.0 days.

Mean length of stay varied considerably according to whether or not surgery was performed. The mean length of stay for discharges with surgery was 15.2 days; for discharges without surgery, the mean was 13.1 days. Surgical discharges had a higher proportion of long-stay cases and a lower proportion that ended with the death of the patient. Of all discharges with surgery, only 5 percent were terminated with the death of the patient; these stays tended to be very long, the mean and median length of stay reaching 21.2 days and 16.4 days, respectively. Table B shows the details. Of all discharges without surgery, 12 percent ended with the death of the patient; these stays generally were of shorter duration, the mean and median length of stay registering 12.4 and 6.7 days, respectively.

AGE, RACE, SEX

The mean length of stay per discharge rose substantially with age, increasing from 12.5 days at ages 67–68 to 15.9 days at ages 85 and over. The increase in mean length of stay with age held for discharges with and without surgery.

It has been shown in this report that women had lower discharge rates than men, 244 per 1,000 enrollees and 280 per 1,000, respectively. In contrast, women averaged stays of nearly 1 day longer than men—14.2 days and 13.3 days, respectively. Beginning at ages 75–79 the differences in mean length of stay by sex increased further, reaching 2 days at ages 85 and over—16.7 days for women and 14.7 days for men (table C).

¹⁰ Various studies show that the initial impact of Medicare generated longer hospital stays by the aged. Estimates of the increase in mean length of stay in short-stay hospitals for persons 65 years of age and over from the year before to the year after Medicare have been reported in the range of 4.1 to 7.8 percent. See Julian Pettengill, op. cit.

Table B.—Percentage distribution of discharges from short-stay hospitals under HI, by surgical and discharge status and by length of stay, 1967

	All discharges			With surgery			Without surgery

36–42	2.2	2.1	3.0	2.7	2.6	5.8	1.9	1.8	2.3	
43 days and over	4.3	4.0	6.7	5.0	4.6	12.0	3.9	3.7	5.6	
Mean	13.8	13.8	13.9	15.2	14.8	21.2	13.1	13.2	12.4	
Median	9.9	10.0	8.1	11.3	11.0	16.4	9.2	9.4	6.7	

Similarly, persons of races other than white had a lower discharge rate than white persons—189 per 1,000 enrollees and 266 per 1,000, respectively—whereas the length of stay for persons of other races averaged 1.3 days longer than white persons—14.9 days and 13.6 days, respectively. Differences in length of stay by race generally held for all age groups except for those 85 years and over where the mean length of stay for both races was nearly equal—15.7 days for those of other races and 15.8 days for white persons (table C).

Differences found in mean length of stay by age and sex held for white persons only. For men and women of other races, mean length of stay did not increase consistently with age and the length of stay for men exceeded that for women in several age groups (figure 3).

GEOGRAPHIC DISTRIBUTION

Mean length of stay varied considerably by geographic area, ranging from a high of 16.1 days or 17 percent above the national figure in the Northeast to a low of 11.8 days or 14 percent below the United States average in the West—a difference of 4.3 days. Earlier in this report crude discharge rates were standardized by age, race, and sex for each region. For similar reasons and using the same method, length of stay averages in each region were standardized. The crude mean length of stay and the standardized mean length of stay for persons of known race, for the United States and the four regions were:

Region	Crude mean length of stay	Standardized mean length of stay
United States	13.8	13.8
Northeast	16.1	16.2
North Central	14.6	14.6
South	12.3	12.2
West	11.8	11.9

A comparison of the crude and adjusted figures in the above table shows that the standardization procedure altered the mean length of stay by no more than 0.1 days in any region.

¹ Ratio of mean length of stay for men to that for women.

By divisions, the mean length of stay varied 5.4 days, ranging from 16.5 days in the Middle Atlantic States to 11.1 days in the West South Central States (see table D). The longer mean length of stay observed nationally for discharges with surgery also occurred in every geographic division. In most divisions surgical cases had stays that were 2–3 days longer on the average than nonsurgical cases; the two notable exceptions were in the Mountain and Pacific States where the mean length of stay for hospitalizations with surgery exceeded the mean for nonsurgical stays by only 0.7 days.

Table D.—Mean length of stay for discharges from short-stay hospitals under hospital insurance, by surgical status and by divisions, 1967

	Mea	Mean length of stay in days

HOSPITAL CHARACTERISTICS

The average length of stay varied by type of hospital control and bed size. Discharges from voluntary hospitals averaged two days longer than those from hospitals under proprietary control, 14.0 days and 12.0 days, respectively.

Table E.—Average length of stay for short-stay hospital discharges under hospital insurance, by adult bed size and type of hospital control, 1967

		A	verage leng	th of stay	(in days)	
Bed size	All short-		Voluntary		Govern- ment,	
	stay hospitals	Total	Church	Other	Proprie- tary	Federal non-
Total Less than	13.8	14.0	13.7	14.2	12.0	13.7
25 beds	11.5	12.1	11.3	12.4	10.3	12.1
25-49	11.8	12.4	11.8	12.5	10.8	11.8
50-99	12.9	13.2	12.7	13.4	11.9	12.7
100-149	13.4	13.5	13.2	13.6	13.2	13.3
150-199	13.6	13.4	13.4	13.4	13.6	14.3
200-249	14.0	14.0	13.8	14.2	14.1	14.1
250-299	14.2	14.2	14.0	14.3	13.1	14.7
300-399	14.5	14.5	14.2	14.9	15.0	14.2
100-499	14.9	14.7	14.1	15.4		15.7
500-749	15.8	16.1	15.2	16.5	_	14.9
750 or more $_$	16.8	16.8	14.4	16.9	_	18.2

The mean length of stay rose consistently with hospital size, increasing from 11.5 days for hospitals with less than 25 beds to 16.8 days for hospitals with 750 beds or more. This trend, which generally held in hospitals under each of the various types of control (see table E), is generally attributed to the fact that larger hospitals offer more specialized services and equipment. Consequently, their patient mix includes more complicated cases and, as noted earlier, more surgical cases resulting in longer stays. For each bed size category under 100 beds the mean length of stay was lowest for hospitals under proprietary control.

Not only did the mean length of stay vary with bed size but also the distribution of discharges by length of stay intervals. Small hospitals had more discharges that were of a short duration and fewer discharges that were of long duration, compared with large hospitals. It may be observed in table F that hospitals with less than 100 beds had 47.5 percent of their discharges averaging stays of 7 days or less and 8.4 percent of their discharges with stays of more than 28 days. In contrast, hospitals with 500 beds or more had only 33.5 percent of their discharges with stays of 7 days or less and 14.1 percent with stays of more than 28 days.

Table F.—Percentage of short-stay hospital discharges under hospital insurance, by adult bed size and length of stay, 1967

		Length of stay

100-299	100.0	40.0	29.1	13.9	7.1	10.0				
300-499	100.0	35.9	27.6	15.2	8.0	11.3				
500 or more	100.0	33.5	28.0	15.7	8.7	14.1				

Table G gives a percentage distribution of discharges by length of stay intervals, bed size, and surgical status and shows that surgical discharges are associated with larger hospitals and longer hospital stays. Of all surgical discharges, only 17.6 percent occurred in hospitals with less than 100 beds; the corresponding figure for discharges without surgery was nearly twice as large—34.3 percent. Moreover, 33.5 percent of all discharges with surgery were stays of 7 days or less in contrast to 44.1 percent for discharges without surgery. It may be observed in table G that as bed size increases and as length of stay intervals increase, greater relative proportions of surgical discharges than nonsurgical discharges occur.

Under the provisions of the Medicare law, accreditation by the Joint Commission on Accreditation of Hospitals (JCAH) was deemed equivalent to meeting all conditions for participation under Medicare other than utilization review and equal rights requirements.

Table G.—Percentage of short-stay hospital discharges under hospital insurance, by adult bed size, length of of stay and surgical status, 1967

		Length of stay						
Surgical status and bed size	Total	7 days	8-14 days	15-21 days	22-28 days	More than 28 days		
With surgery:								
All hospitals	100.0	33.5	30.3	15.7	8.3	12.2		
Less than								
100 beds	17.6	6.6	5.3	2.5	1.3	1.9

Hospitals accredited by the JCAH accounted for 4.2 million discharges or 83 percent of the total of 5.1 million discharges from short-stay hospitals under Medicare in 1967. Mean length of stay for discharges from JCAH-accredited hospitals was 14.0 days, slightly higher than the mean of 13.8 days for discharges from all hospitals.

Of the total discharges, 19.6 percent were from hospitals with major medical school affiliation. Mean length of stay in these hospitals—15.4 days—was more than one and a half days longer than discharges from all hospitals. Discharges from hospitals with approved intern programs represented 15.7 percent of the total discharges; mean length of stay in these hospitals (15.0 days) was nearly equal to that for hospitals with major medical school affiliations. Discharges from hospitals with approved resident programs only (2.7 percent of the total) had a mean length of stay of 13.9 days, similar to that for all hospitals.

Accreditation,	Me	Percent of		
affiliation, and training program	Total	With surgery	Without surgery	total discharges

program Hospitals with	15.0	16.0	14.4	15.7
approved resident program only	13.9	14.3	13.6	2.7

Days of Care

Short-stay hospital discharges under Medicare in 1967 accounted for 69.7 million days of care—an annual rate of 3,575 days of care per 1,000 enrolled persons. Ninety-five percent or 66.2 million days of care were covered days, i.e., paid for in full or in part by HI reimbursement.

AGE, RACE, SEX

The most striking differences in the number of days of care per 1,000 enrolled persons were found by age. The annual rate of use of days of care more than doubled with increasing age, from 2,657 days per 1,000 enrollees aged 67-68 years to 5,891 days per 1,000 enrollees 85 years and over—an increase of over 120 percent. For every age group the number of days of care was higher for men than for women and for white persons compared with persons of other races. Figure 4 illustrates the differences in the number of days of care per 1,000 enrollees by age, race, and sex. It may be observed that the rate for white men was consistently greater than that for white women, the difference generally holding constant for all age groups. For persons of other races, the difference between men and women was wide at ages 65-66 years, then narrowed with advancing age but widened sharply again beginning with the age group 80-84 years.

Table H.—Annual rate of short-stay hospital days of care per 1,000 enrolled persons under hospital insurance, by age, race, and sex, 1967

¹ Rate for men to rate for women.

¹¹ See notes preceding the General Tables for definitions and explanations of terms used in this report relating to hospital affiliation and accreditation.

¹² Estimates of the increase in number of days of care in short-stay hospitals per 1,000 persons 65 years of age and over from the year before to the year after Medicare have been reported in the range of 8.9 to 16.0 percent. See Julian Pettengill op. cit.

Table H gives the number of days of care per 1,000 enrollees by age, race, and sex, and shows the ratio of the rate for men to that for women.

Overall, the annual rate for men was 7 percent greater than that for women—3,713 days per 1,000 for men and 3,473 for women. Differences by sex generally prevailed regardless of age. However, differences were greatest for those 65–66 years (21 percent). Thereafter, differences decreased for successive age groups to a low of 7 percent at ages 71–72. For persons above ages 71–72, rates for men were 8 to 10 percent higher than those for women.

Relationships between races by sex and age (derived from table H) are shown below. Differences by race averaged 20 percent higher for white men; a principal exception was found in the age group 65–66 when the rate for white men was lower than that for men of other races. Differences by race were greater for women, averaging 36 percent, primarily reflecting large differences by race for women aged 80 and over.

$\mathbf{A}\mathbf{g}\mathbf{e}$	Ratio of rate for white persons to rate for persons of other races					
	Men	Women				
65 years and over 65-66	1.20 .89 1.07	1.36 1.24 1.22				
69-70	1.15 1.31 1.30	1.23 1.34 1.31				
75–79 80–84 85 and over	1.29 1.22 1.35	1.32 1.49 1.59				

GEOGRAPHIC DISTRIBUTION

The annual rate of days of care per 1,000 HI enrollees reflects the annual discharge rate and the average length of stay. If the discharge rate in an area is higher than the national average and the mean length of stay lower than the national average (or vice versa), then the annual rate of days of care tends toward the mean. If these two measures of utilization are not offsetting, then the annual rate of days of care tends toward the extremes of the range.

In two regions the patterns were not opposite. The North Central Region had the highest annual rate of days of care—4,052 days per 1,000 reflecting that region's relatively high annual discharge rate (6 percent above the national average) and relatively high mean length of stay (also 6 percent above the national average). In contrast, the West had the lowest annual rate of days of care—3,151 days per 1,000 reflecting primarily the mean length of stay there which was

lowest of all the regions (14 percent below the national average). The discharge rate in the West was close to the national figure.

In the other two regions the patterns were markedly opposite. In the Northeast the discharge rate was 17 percent below the national average whereas the mean length of stay was 17 percent above average, producing an annual rate of days of care near the national average, 3,501 per 1,000 or 3 percent below the figure for the Nation. The reverse pattern was found in the South. The discharge rate was 8 percent above that found nationally while the mean length of stay was 11 percent below, resulting in an annual rate of days of care of 3,474 per 1,000 or just 4 percent below that for the country as a whole.

In five of the nine divisions—New England, Middle Atlantic, East South Central, West South Central, and Mountain—the discharge rate and the mean length of stay somewhat counterbalanced each other so that the number of days of care per 1,000 enrolled in those divisions tended toward the U.S. average. In the remaining four divisions the discharge rate and the mean length of stay were either both above or below the national average. In the West North Central division both measures were above the national figure and produced the highest number of days of care per 1,000 enrolled—4,240 or 18 percent above that for the U.S. In contrast, in the Pacific division both measures were below the U.S. figure and resulted in the lowest number of days of care per 1,000-2,923 or 19 percent below the national average.

MONTHLY UTILIZATION

Figure 5 illustrates the seasonal variation in hospital utilization under Medicare by presenting monthly figures on short-stay hospital discharges. For com-

Figure 1.—Annual rate of short-stay hospital discharges
per 1,000 enrolled persons by age, race, and sex, 1967

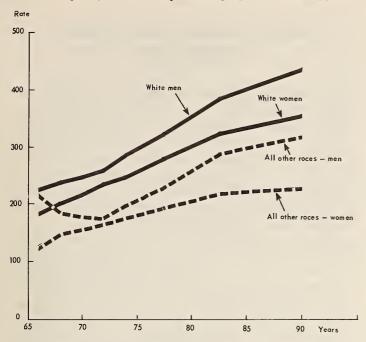

Figure 2.—Percentage distribution of discharges by discharge status and by length of stay, 1967

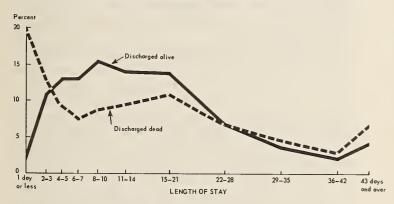

Figure 3.—Mean length of stay per discharge in short-stay hospitals by age, race and sex, 1967

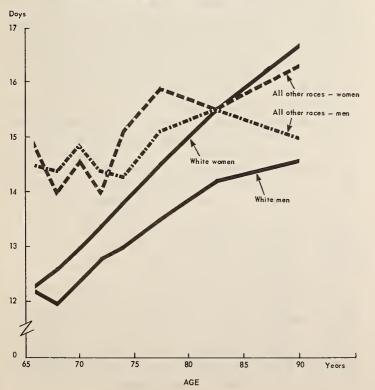

Figure 4.—Annual rate of short-stay hospital days of care per 1,000 enrolled persons by age, race, and sex, 1967

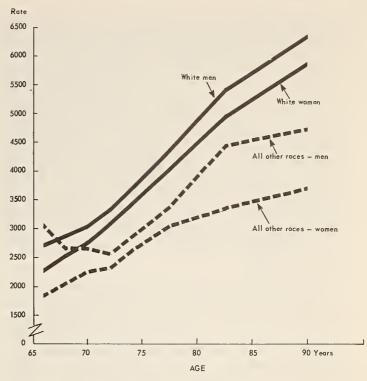

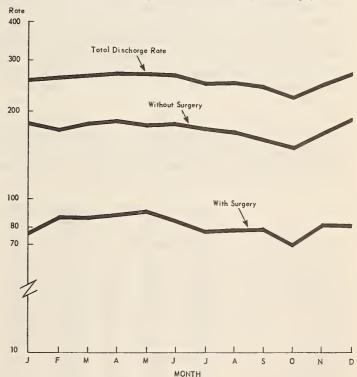

Figure 5.—Annual rate of short-stay hospital discharges per 1,000 enrolled persons by month of discharge, 1967

parability, the number of discharges recorded for each month was converted to an annual number of discharges by taking into account the number of days in the month. Then, an annual rate of discharges was computed based on the HI enrollment that month. Similar monthly figures on mean length of stay, annual rate of days of care, and daily bed usage rate are presented in table J. The annual rate of days of care per 1,000 enrollees by month was approximated by first allocating days of care utilized in a hospital stay to the month in which the discharge occurred. Then, annual rates were computed using the same procedure described above for converting monthly discharge figures to annual rates. Daily bed usage rates by month were calculated by dividing the annual rate of days of care by 365.

Discharge rates increased during the first 4 months of the year, reaching a peak in April—277 discharges per 1,000 enrollees; rates then fell steadily to a low of 223 discharges per 1,000 in October and then began to rise again. It may be observed from the semilogarithmic scale used in Figure 5 that relative seasonal variations in discharge rates for discharges without surgery were similar to seasonal variations found for discharges with surgery. See table 4.1.17 for details.

Length of stay was highest in January, 14.3 days, then decreased steadily during the next 3 months to 13.5 days in April; length of stay figures remained much the same from April through September and then registered higher during the last quarter of the year, 13.9 days.

Table J.—Number and annual rate of discharges, mean length of stay, annual rate of days of care, and daily bed usage rate for short-stay hospital discharges under hospital insurance, by month, 1967

Month of discharge in 1967	Number of dis- charges (in thou- sands)	Annual rate of discharges per 1,000 enrollees	Mean length of stay	Annual rate of days of care per 1,000 enrollees	Daily bed usage rate per 1,000 enrollees
Total January February March April May June July August September October November	5,055 425 391 445 441 452 432 422 419 390 371 410	259 260 264 270 277 274 270 255 252 242 223 252	13.8 14.3 14.1 13.8 13.5 13.6 13.5 13.7 13.6 13.7 13.9 13.9	3,575 3,713 3,732 3,741 3,740 3,720 3,640 3,489 3,425 3,324 3,085 3,492	9.8 10.2 10.2 10.2 10.2 10.2 10.0 9.6 9.4 9.1 8.5 9.6
December	455	273	13.9	3,797	10.4

The daily bed usage rate—which is proportional to the annual rate of days of care—was high for the first 5 months of the year, 10.2 beds per day per 1,000 HI enrollees. Beginning in June this rate fell steadily each month to 8.5 beds per day per 1,000 enrollees in October and then began to rise, reaching the highest value for the year in December, 10.4 beds per day per 1,000.

Hospital Charges and Amounts Reimbursed

Total hospital charges for short-stay hospital discharges under Medicare in 1967 were \$3.4 billion. Under the hospital insurance program the patient is responsible for certain charges, including deductibles, coinsurance, and charges for other noncovered services. These nonreimbursable charges, which amounted to approximately \$367 million or 10.7 percent of total hospital charges, are discussed in the section, "Hospital Charges Not Reimbursable by Medicare."

After the nonreimbursable charges were excluded, \$2.7 billion or 78.3 percent of total hospital charges were reimbursed by the program. HI payments shown in this report reflect reimbursements based on interim rates, usually established as a per diem amount or as a percentage of total charges. The final amount due each hospital is determined after the end of the fiscal year on the basis of the hospital's audited reasonable costs of operation. Audited cost reports available for 1967 indicate that additional payments were made of approximately 5 percent over the amounts paid on an interim basis.

In summary, of the total hospital charges for shortstay hospital services in 1967, patients were responsible for approximately 10.7 percent, HI interim payments totaled 78.3 percent and additional payments based on audited cost reports amounted to approximately 5 percent over interim reimbursements. Thus, hospital charges for which patients were responsible plus interim and final HI reimbursements amounted to about 93 percent of total hospital charges. The remainder—about 7 percent of total hospital charges not reimbursed—represents, primarily, the difference between hospital charges to Medicare patients and hospital costs and reflects, in part, the exclusion of profits from Medicare reimbursement. A second factor reflected in the difference between hospital charges and costs involves the policy that hospitals pursue of not directly equating their charges for various services with the costs of providing these services.14

Hospital charges for HI beneficiaries averaged \$49 per day and \$675 per discharge. These figures include room and board and charges for ancillary services. Table K indicates that there is an inverse relationship between the length of stay and the average charge per day. As the length of the hospital stay increased, mean charges per day generally decreased. The average charge per day for stays of 7 days or less was \$57 compared with \$39 per day for stays of 43 days or more. This pattern is due to the fact that charges in short-stay hospitals are generally composed of two

¹³ P.L. 92-603, the 1972 Social Security Amendments, Section 223, established limits beyond which costs are deemed to be in excess of those necessary to provide efficiently delivered health services. These limits apply to cost reporting periods beginning on or after July 1, 1974.

on or after July 1, 1974.

"For a discussion of the relationships between hospital charges and costs see Karen Davis and Richard W. Foster, Community Hospitals: Inflation in the Pre-Medicare Period, pp. 39-49, Office of Research and Statistics, Research Report No. 41, U.S. Social Security Administration.

basic elements: room and board and ancillary services. During the hospital stay daily room and board charges generally remain fixed while ancillary service charges vary, although many charges (e.g., operating room) are incurred only during the first few days of the hospital stay. As a result, as the length of stay increases, ancillary service charges tend to have a lesser effect on mean charges per day.¹⁵

As the length of stay increased mean charges per discharge increased more than tenfold. Hospital stays of 7 days or less averaged \$240; stays of 43 days or more averaged \$2,695 per discharge. As many be observed in table K, stays of 43 days or more accounted for 17.1 percent of total hospital charges, although these hospitalizations represented only 4.3 percent of all discharges (see table B).

Mean charges per day and per discharge were considerably higher for discharges with surgery, averaging \$57 per day and \$867 per discharge. For nonsurgical cases mean charges averaged \$45 per day and \$585 per discharge.

The same charge patterns that were observed for all discharges—i.e., a decrease in the mean charge per day and an increase in the mean charge per discharge as length of stay increased—held for discharges with or without surgery, and were of a similar magnitude.

AGE, RACE, SEX

Average charges per day decreased with age, declining from \$52 for persons at age 67-68 to \$43 for persons 85 years and over. In every age group mean charges per day were greater for discharges with surgery compared to those without surgery. However, the same pattern of decreasing charges per day as age increased was found for stays with or without surgery (table L). This pattern probably reflects the longer stays experienced by each successive age group which, in turn, are associated with decreasing charges per day (table K). Furthermore, mean charges per day were lower for women (\$47) than for men (\$51) and for persons of other races (\$45) than for white per-

sons (\$49). These differences were found for discharges with or without surgery and, again, probably reflect the longer stays experienced by women compared to men and by persons of other races compared to white persons.

Overall, charges for a hospital episode showed only small variations by age. Average charges per stay followed a pattern of rising very slowly with advancing years (\$651 at ages 65–66 and \$686 at ages 75–79), holding constant for the next age group, and then falling slightly to \$684 for patients 85 years and over. Mean charges for discharges without surgery generally followed this same pattern. In contrast, hospital charges for surgical cases showed substantial increases as age increased, rising from \$795 per discharge at ages 65–66 to \$1,010 per discharge at ages 85 and over. Mean charges were slightly higher for men (\$680) than for women (\$671) and for persons of races other than white (\$678) than for white persons (\$672).

As shown in table L, the percent of total hospital charges reimbursed under the program increased slowly with advancing age, rising from 77.3 percent at ages 67-68 years to 80.1 percent at ages 85 years and over. The percentage reimbursed was higher for women than for men and for persons of other races than for white persons. It appears that higher percentages reimbursed by Medicare are associated with longer stays which, in turn, are associated with lower mean charges per day. The inverse relationship between the percentage reimbursed and mean charges per day may reflect, in part, the method of paying some providers an interim reimbursement that is based on a per diem (i.e., fixed) amount. For persons with longer stays and, generally, lower mean charges per day, the per diem amount would represent a higher percentage reimbursed.

GEOGRAPHIC DISTRIBUTION

There were large variations in hospital charges by geographic area. As shown in the table below, mean charges per day were highest in the Pacific division—\$64; compared with the lowest mean charges per day in the West North Central division of \$40, rates in the Pacific division were 60 percent higher.

Table K.—Mean charges per day and per discharge for short-stay hospital discharges under hospital insurance, by length of stay and surgical status, 1967

Length of stay		Total			With surge	ry	Without surgery

Mean charges per discharge in the Middle Atlantic division, \$904, were nearly 100 percent higher than in the West South Central division, \$465, reflecting the fact that the Middle Atlantic division had the longest mean length of stay (16.5 days) and a relatively high mean charge per day (\$55) whereas the West South Central division had the shortest mean length of stay (11.1 days) and a relatively low mean charge per day (\$42).

Geographic division	Mean charges per day	Mean charges per discharge	Percent of charges reimbursed
All areas	\$49	\$675	78.3
United States	49	677	78.3
Northeast	55	884	74.9
New England	56	830	81.7
Middle Atlantic	55	904	72.6
North Central	45	662	80.0
East North Central	48	720	80.4
West North Central	40	563	79.3
South	43	531	76.9
South Atlantic	45	597	78.0
East South Central	42	504	71.8
West South Central	42	465	78.6
West	60	706	83.3
Mountain	49	604	75.8
Pacific	64	743	85.5

As may be seen in the above table, there were wide differences by division in the percent of charges that were reimbursed by the program. The Pacific division had the highest proportion (85.5 percent) of total hospital charges reimbursed on an interim basis; the East South Central division had the lowest percentage (71.8).¹⁶

HOSPITAL CHARACTERISTICS

Mean charges per day and per discharge varied considerably by type of hospital control and adult bed size. Charges were highest in hospitals under voluntary control—averaging \$52 per day and \$727 per discharge—and lowest in government-controlled non-Federal hospitals—averaging \$39 per day and \$531 per discharge (table M).

Mean charges per day increased about 75 percent as adult bed size increased, rising from an average of \$33 per day in hospitals with less than 25 beds to \$59 per day in hospitals with 500-749 beds. This trend is generally attributed to the fact that as the size of the hospital increases specialized services and equipment tend to increase and charges for such services are reflected in mean charges per day. It has been noted earlier in this report that as bed size increases mean length of stay also increases which, similarly, is attributed to the availability of specialized services for treating more serious and complicated conditions that require longer hospitalizations. Mean charges per discharge rose more than 150 percent as bed size increased—ranging from an average of \$375 per discharge for hospitals with less than 25 beds to \$972 per discharge for hospitals with 750 beds or more—reflecting the rise in mean length of stay coupled with the rise in mean charges per day as bed size increases.

It may be observed in table M that although mean charges per day for discharges from proprietary hospitals were close to the average for all hospitals (\$50 and \$49, respectively) mean charges per day in each bed size category for proprietary hospitals (with the exception of the category 300–399 beds which comprised only 1.1 percent of proprietary hospital discharges) exceeded those for all hospitals. Moreover, although mean charges per discharge from proprietary hospitals (\$599) were below the average figure (\$675), proprietary hospital charges exceeded the

¹⁶ Interim payments under the program are intended to approximate hospital costs. Geographic variations in the percentage of hospital charges reimbursed by the program may reflect, in part, differences by area in the relationship between hospital charges and costs of hospital operation that are paid by the program. Medicare data show that the percentages of hospital charges paid on an interim basis for 1970–1972, by division, was similar to that found for 1967, by division.

Table M.—Mean charges per day and per discharge and percent of charges reimbursed for short-stay hospital discharges under Medicare, by adult bed size and type of hospital control, 1967

					M	ean hospit	al cha	rges

Percent reimbursed		78.3		77.5		78.0	77.2		75.9		83.1		

average in most bed size categories and were markedly greater in hospitals with 100–149 beds, 150–199 beds, and 200–249 beds.¹⁷

The percentage of hospital charges reimbursed by HI was highest for hospitals under government control (83.1) and lowest for hospitals under proprietary control (75.9). These differences in interim payments probably reflect differences in the relationship between hospital charges and reasonable costs of operation.

Hospital Charges Not Reimbursable by Medicare

Medicare patients were responsible for payment of nearly \$333 million in nonreimbursable charges for hospital stays in which there was some reimbursement under HI. This amount represented 9.7 percent of total hospital charges. (Patients were also responsible for an additional amount, estimated at \$34 million or 1 percent of total charges for hospitalizations for which there was no HI reimbursement. In total, approximately \$367 million or 10.7 percent of shortstay hospital charges in 1967 were nonreimbursable under the program.)

Nonreimbursable charges include the inpatient hospital deductible, coinsurance amounts, blood deductible amounts, and charges for noncovered services. In 1967 the inpatient hospital deductible was \$40 and the coinsurance amount was one-fourth the deductible or \$10 per day for the 61st-90th day of hospitalization in a benefit period. Under the HI program, the patient is also responsible for the first three pints of blood in

a benefit period which are not replaced by or on behalf of the beneficiary. Noncovered services include days of care after benefits are exhausted and other services such as television and telephone rentals and private duty nursing services.

Table N shows the distribution of nonreimbursable charges by type and by the number of hospital stays. Persons with one or more hospital stays (3.6 million HI enrollees) averaged \$91 during the year in nonreimbursable charges. Of this amount, the inpatient deductible comprised 49 percent, coinsurance—nearly 7 percent, the blood deductible—3 percent, and other noncovered services-41 percent. As the number of hospital stays increased, total charges for which the patient was responsible increased, rising from an average of \$69 for persons with one stay only to \$220 for those with three or more stays. As the number of hospital episodes increased the inpatient deductible represented a smaller proportion of the total charges for which the patient was responsible, decreasing from nearly 57 percent for those with one stay only to 32 percent for those with three or more stays.

As expected, coinsurance charges—as a percentage of total charges for which the patient was responsible—increased as the number of hospital stays increased, although accounting for only 12 percent of total nonreimbursable charges for those with three or more stays. Other noncovered service charges increased substantially as the number of stays increased, representing nearly 53 percent of the total nonreimbursable charges for those with three or more stays.

As shown below, as age increased average nonreimbursable charges increased, rising from \$87 for patients aged 67–68 years to \$100 for those 85 years and over, the difference primarily due to coinsurance charges and charges for other noncovered services (table 4.1.16).

¹⁷ For trends in the financial position of nongovernmental community hospitals, including data on charges in nonprofit and proprietary hospitals, see Julian Pettengill, "The Financial Position of Private Community Hospitals, 1961–71," Social Security Bulletin, November 1973.

¹ Includes nonreimbursable charges for hospital stays in which there was some reimbursement under HI. Excludes an estimated \$34 million in nonreimbursable charges for stays in which there was no reimbursement under the program.

Men and women averaged the same amount in non-reimbursable charges—\$91. Differences were found by race—white persons averaging \$91 and persons of all other races averaging \$79 in nonreimbursable charges, the difference due primarily to higher charges for noncovered services utilized by white persons.

Overall, nonreimbursable charges represented 9.7 percent of total hospital charges. As age increased this percentage tended to increase. Hospitalized persons aged 67–68 years were responsible, on the average, for 9.6 percent of their total hospital charges; the corresponding figure for persons 85 years of age and over was 10.8 percent. Men had 9.5 percent of total hospital charges that were nonreimbursable; women had 10.0 percent nonreimbursable. White persons and persons of other races averaged 9.7 and 8.8 percent, respectively, in nonreimbursable charges.

Age, sex, and race	Total non- reimbursable charges per person discharged	Nonreimbursa- ble charges as a percent of total hospital charges

Number of Persons with One or More Discharges 18

In 1967 there were 3,649,000 persons who were discharged from short-stay hospitals under Medicare. As summarized in the table below, approximately 75 percent had one hospital stay, 18 percent had two stays, and the remaining 7 percent had three or more stays. In all, they accounted for 5,055,000 discharges. Persons with more than one stay (25 percent) accounted for 46 percent of the discharges during the year.

	Persons s	erved	Discharges			
Number of stays	Number (in thou- sands)	Per- cent	Number (in thou- sands)	Per- cent		
All stays 1 stay only 2 stays only 3 stays or more	3,649 2,722 658 269	100.0 74.6 18.0 7.4	5,055 2,722 1,315 1,018	100.0 53.9 26.0 20.1		

The number of persons with at least one stay, at least two stays, or at least three stays may be expressed as a percent of the population-at-risk and the result interpreted as the probability of at least one, two, or three stays. It may be observed below that a person who was hospitalized once and discharged alive has a greater probability of a second hospital admission (27.9 percent) that year than the average member of the enrolled population has of being hos-

¹⁸ Marian E. Gornick, "Persons Meeting the SMI Deductible, 1966-71." HI-57. April, 15, 1974. Office of Research and Statistics, U.S. Social Security Administration, Washington, D.C.

pitalized at all that year (17.6 percent). And, a person who was discharged alive twice has a greater probability of a third admission that year (32.9 percent) than a person hospitalized once had of being admitted for a second stay.

Age _	Persons served as a percent of population-at-risk					
	At least 2 stays	At least 3 stays				
All persons, 65 years						
and over	27.9	32.9				
65–66	22.3	29.8				
67–68	26.3	33.1				
69–70	27.0	32.6				
71–72	27.4	32.5				
73–74	28.1	33.0				
75–79	29.5	33.7				
80-84	30.3	33.9				
35 and over	30.8	33.4				

¹ The population-at-risk to one stay are all persons enrolled in HI at any time during 1967; at-risk to two hospital stays are persons discharged alive from the first stay; at-risk to three stays are persons discharged alive from the second stay. The population-at-risk is somewhat overstated for higher order discharges since Medicare data show that 200,000 persons who received inpatient hospital services in 1967 were discharged alive but died that year. However, counts are not available to distinguish how many of these persons died after the first hospitalization or after a second or higher-order hospitalization.

As shown in the table below, the probability of having at least two hospital stays increased slowly with age, rising from 26.3 percent at ages 67–68 to 30.8 percent at ages 85 years and over. However, the probability of having more than two stays held nearly constant with advancing age, registering 33.1 percent and 33.4 percent for the same two age groups.

	Population- at-risk ¹	Persons served	Persons served as a		
Number of stays	Number (in thou- sands)	Number (in thou- sands)	percent of population- at-risk		
At least 1 stay	20,680	3,649	17.6		
At least 2 stays	3,322	927	27.9		
At least 3 stays	818	269	32.9		

Similarly, the number of persons discharged dead at the first stay, second stay, or third or higher-order stay may be expressed as a percent of total persons discharged (alive or dead) and the result interpreted as the probability of dying during a hospitalization. As might be expected, the probability that a hospitalization ended with the death of the patient increased with repeated hospitalizations. The probability of being discharged dead at the end of the third or higher-order stay (19.5 percent) was more than twice that of being discharged dead at the end of the first stay (9.0 percent).

Order of stay	Total persons discharged	Persons discharged dead	Persons discharged dead as a percent of	
	Number (in thousands)	Number (in thousands)	total persons discharged	
1st stay	3,649	327	9.0	
2nd stay	927	109	11.8	
3rd or higher stay	269	52	19.5	

As shown in the table below, the probability of being discharged dead at the end of the first, second, or third or higher-order stay increased with increasing age. For the first stay the probability of being discharged dead increased from 5.5 percent at ages 67–68 to 16.9 percent at ages 85 years and over. The probability of being discharged dead at the end of the second stay ranged from 9.2 percent to 17.7 percent between these same two age groups. For the third or higher-order stay the probability of being discharged dead was 17.0 percent at ages 67–68 and rose to 23.6 percent at ages 85 years and over.

	Persons discharged dead as a percent of total persons discharged							
Age	1st stay	2nd stay	3rd or higher- order stay					
All persons, 65 years and over	9.0	11.8	19.5					
65–66 67–68 69–70	5.3 5.5 6.3	9.1 9.2 9.3	17.3 17.0 17.3					
71–72 73–74	$\frac{6.9}{7.9}$	9.9 10.8 12.3	18.6 19.1 19.8					
75-79 80-84 85 and over	$9.5 \\ 12.4 \\ 16.9$	12.3 14.4 17.7	21.8 23.6					

Data derived from table 4.1.15 show that men had a higher probability of being discharged dead compared to women, the difference ranging from 25 to 35 percent greater for men according to the order of the stay.

Persons of other races had a higher probability of being discharged dead than white persons, the differences ranging from 18 to 31 percent greater for persons of other races according to the order of the stay (derived from table 4.1.15).

It has already been shown that the number of discharges per 1,000 persons enrolled in HI was 259 for all ages and increased 74 percent with increasing age, the discharge rate rising from 213 discharges per 1,000 for those 67–68 years of age to 370 discharges per 1,000 for those 85 years of age and over. Moreover, the number of persons with at least one hospitalization during the year per 1,000 persons enrolled was 187 and increased 78 percent with increasing age, this rate rising from 154 persons per 1,000 at ages 67–68 years to 274 persons per 1,000 at ages 85 and

over (table 0). The average number of hospital stays for those with at least one hospital episode, i.e., the ratio of the number of discharges to the number of persons discharged, was 1.39 as shown below. This ratio did not increase with increasing age but remained relatively constant throughout all age groups. Thus, contrary to what might be expected, repeated hospitalizations were no more frequent among the older age groups than among the younger age groups. This finding reflects, in part, the increased probability of being discharged dead as age increases.

Age, sex, and race	Ratio of number of discharges to number of persons discharge					
All persons, 65 years						
and over	1.39					
65–66	1.38					
67–68	1.38					
39–70	1.39					
1–72	1.39					
73–74	1.39					
75–79	1.40					
30-84	1.39					
5 and over	1.35					
Sex	1.00					
	1.42					
Men						
Women Race	1.36					
TX7h:+-	1.00					
	1.39					
Other races	1.33					

It may be observed that the average number of stays for men who had at least one stay was 1.42 and for women, 1.36. For white persons the average was 1.39 and for those of other races the average was 1.33.

Mean days of care per person with at least one stay averaged 19.1 days and increased with age from 17.3 days at ages 67–68 to 21.9 days at ages 85 years and over (table 0). Persons with only one stay averaged 14.0 days of care. Persons with two stays averaged 28.8 days of care. Thus, the second hospital stay appears to average the same length as the first. Persons with three or more stays averaged 46.9 days of care,

a little more than 3 times that for persons with one stay. This pattern was generally true for all age groups. Mean charges per person with one or more stays averaged \$935 and increased moderately with increasing age up through ages 75–79 and then declined slightly for the oldest age groups. Mean charges per person were higher for men (\$962) than for women (\$913) and for white persons (\$934) than for persons of all other races (\$904). Mean charges per person with one stay only was \$698 and virtually doubled for persons with two stays (\$1,403) and tripled for persons with three or more stays (\$2,190). This pattern was generally true for all age groups.

Reliability of Estimates

Data in this report are estimates based on discharges for a 20-percent sample of the population enrolled for hospital insurance and hence are subject to sampling errors. Estimates for such sampling error are presented in tables P through Z.

The sample estimate and an estimate of its standard error permit us to construct interval estimates with prescribed confidence that the interval includes the average result of all possible samples.

To illustrate, if all possible samples were selected, each of these were surveyed under essentially the same conditions, and an estimate and its estimated standard error were calculated from each sample, then—

i. approximately two-thirds of the intervals from one standard error below the estimate to one standard error above the estimate would include the average value of all possible samples. We call an interval from one standard error below the estimate to one standard error above the estimate a two-thirds confidence interval.

Table O.—Number and annual rate of persons discharged, mean days of care, and mean charges for persons with one or more hospital stays under hospital insurance by age, sex, and race, 1967

- ii. approximately nineteen-twentieths of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average value of all possible samples. We call an interval from two standard errors below the estimate to two standard errors above the estimate a 95-percent confidence interval.
- iii. almost all intervals from three standard errors below the sample estimate to three standard errors above the sample estimate would include the average value of all possible samples.

Thus, for a particular sample, one can say with specified confidence that the average of all possible samples is included in the constructed interval.

To derive estimates of standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

To approximate standard errors of numbers not presented directly in tables P through S, simple linear interpolation may be used. For example, table 4.1.1 shows an estimate of \$391,771,000 in total charges for the State of New York. Using linear interpolation in table S gives \$1,927,000 as the approximate standard

Table P.—Approximate standard error of estimated number of discharges

Estimated number of discharges	Standard error	
50	19	
100	$\overline{27}$	
200	38	
300	46	
400	53	
500	59	
1,000	94	
5,000	188	
10,000	267	
25,000	423	
50,000	601	
100,000	856	
150,000	1,055	
200,000	1,225	
250,000	1,376	
500,000	1,990	
750,000	2,484	
1,000,000	2,919	
2,000,000	4,393	
3,000,000	5,646	
4,000,000	6,815	
5,000,000	7,929	

error for \$391,771,000 total charges. Based on these data the two-thirds confidence interval is from \$389,844,000 to \$393,698,000, and a conclusion that the average estimate of total charges in New York derived from all possible samples lies within a range computed in this way would be correct for roughly two-thirds of all possible samples.

To approximate standard errors of numbers not presented directly in table T through Z, double linear interpolation may be needed. As an illustration, in table 4.1.1 Delaware shows \$790 per discharge for 8,637 discharges. Interpolating in table W first to determine the standard error of \$790 for 5,000 discharges gives \$23.74. Similarly, interpolating for a base of 10,000 discharges gives \$16.90. The second part of the double interpolation is completed by interpolating between those derived values for the discharge base of 8,637. This yields the final estimated standard error of \$18.76 which should be rounded to \$19.00. Thus, the two-thirds confidence interval is from \$771 to \$809; the 95 percent confidence interval from \$752 to \$828; and the 99 percent confidence interval from \$741 to \$839. Thus, the conclusions that the average estimates of total charges per discharge for Delaware derived from all possible samples lie within these ranges would be correct the indicated percentages of times.

Table Q.—Approximate standard error of estimated number of persons using services

Provisions of the Law

The health insurance program for the aged, commonly called Medicare, was enacted on July 30, 1965, as Title XVIII of the Social Security Act, and became effective on July 1, 1966. The program, a part of the 1965 amendments (Public Law 89-97), makes available two separate but coordinated insurance coverages—hospital insurance, covering nearly all persons aged 65 and over, and supplementary medical insurance, covering those persons in this age group who enroll voluntarily and pay the premium. Changes in the program effective in 1968 were incorporated in the 1967 amendments to the Social Security Act (Public Law 90-248).

Hospital Insurance Program

The hospital insurance program (Part A of Medicare) pays for a large portion of the costs of hospital and related post-hospital services. It is financed on a self supporting basis through a tax on a portion of current earnings, paid by employees, employers, and self-employed persons. The proceeds of this tax are placed in the Hospital Insurance Trust Fund, from which reimbursements for benefits and administrative expenses incurred under the program are paid. The trust fund is reimbursed from general tax revenues for the costs of providing coverage for persons who qualify for hospital insurance but who are not eligible for monthly social security or railroad retirement benefits.

BENEFITS

Inpatient hospital benefits.—The program covers the cost of covered services in a participating hospital for up to 90 days in a "benefit period" (a period beginning with the first day of hospitalization and ending 60 days after discharge from a hospital or a skilled nursing home). Of the 90 days, full payment is made for the first 60 days of hospitalization after a deductible of \$40 has been paid. For each of the remaining 30 days in the benefit period, the patient pays a coinsurance amount of \$10 a day. The program provides the same benefits for emergency services rendered in a nonparticipating hospital.

Inpatient tuberculosis and psychiatric hospital services are also covered. However, there is a lifetime limit of 190 days of care in a psychiatric hospital.

Where an individual is a patient in a tuberculosis or psychiatric hospital at the time he becomes entitled to hospital insurance, the number of days he was such an inpatient in the 90-day period immediately prior to his eligibility are counted against his 90 days of entitlement in that benefit period.

Covered hospital services include hospital room and board in accommodations containing from two to four beds, nursing services except for private-duty nursing, drugs and biologicals, and all those services ordinarily furnished by a hospital to its inpatients. Coverage under the hospital insurance program does not include the services of physicians (including radiologists, anesthesiologists, pathologists, and physiatrists) except for those services provided by interns or residents in training under approved teaching programs in a hospital.

The cost of the first three pints of blood furnished a patient during a benefit period is a deductible amount unless the patient arranges for replacement. Charges for any additional blood are covered under the program.

Outpatient hospital diagnostic benefits.—These benefits cover the cost of tests and related services that are ordinarily furnished by a participating hospital to its outpatients for the purpose of diagnostic study. Such services are covered subject to a \$20 deductible and 20-percent coinsurance for diagnostic services furnished the beneficiary by the same hospital during a 20-day period. The deductible may be applied towards the \$50 annual medical insurance deductible.

Post-hospital home health care benefits.—These benefits cover the cost of visiting nurse services and related home health services for as many as 100 visits in a year following the patient's discharge from a hospital or extended care facility, provided he has been confined for at least 3 consecutive days in a hospital. A home health plan must be developed by a physician and implemented within 14 days after the patient's discharge from the hospital or extended care facility.

Extended care facility benefits.—The program pays for the reasonable cost of all covered inpatient services in participating extended care facilities (ECF) for up to 100 days of such care in any benefit period, following discharge from a hospital after a stay of 3 consecutive days or more, and admission to an ECF within 14 days of discharge. Full payment is made for

the first 20 days. For each of the remaining 80 days, the patient pays a coinsurance of \$5 a day.

Supplementary Medical Insurance Program

The supplementary medical insurance program (Part B of Medicare) provides coverage of physicians' services, additional home health services, and a variety of other health services. Individuals 65 years of age and over may enroll in the program regardless of whether they are eligible for social security retirement benefits. The insured's monthly premiums are matched by the Federal Government and paid into the Supplementary Medical Insurance Trust Fund, which reimburses carriers for benefits and administrative expenses incurred under the program.

BENEFITS

The SMI program pays for 80 percent of the allowed charges for covered physician services and other medical services after the patient has met a deductible of \$50 during a calendar year. However, payment for outpatient psychiatric physician services is limited to the lesser of \$250 or 50 percent of the allowed charges in any year after the \$50 deductible has been met. The sum and percentage are derived from the statutory provision which permits an incurred expense for out-of-hospital treatment of mental illness of only \$312.50 or 62.5 percent of actual expenses in a calendar year. Since only 80 percent of allowed charges can be reimbursed, the effective maximum becomes \$250.

To preclude the possibility of having to meet a deductible twice in a short period of time, a "carry-over" provision is applied. Accordingly, covered expenses that are incurred in the last quarter of the year and counted toward the deductible in that year are also credited toward the deductible for the following year.

Covered under the program are such benefits as physicians' services, including home, hospital, and office visits; services and supplies, including drugs and biologicals that cannot be self-administered, that are furnished as a part of a physician's professional service, most commonly in his office, and either rendered without charge or included in the physician's bills; diagnostic X-ray tests, diagnostic laboratory tests, and other diagnostic tests; X-ray, radium, and radioactive isotope therapy, including materials and the services of technicians; surgical dressings, splints, casts, and other devices used for reduction of fractures and dislocations; rental of durable medical equipment, including iron lungs, oxygen tents, hospital beds, and wheelchairs used in the patient's home (including an institution used as his home); ambulance service in cases where the use of other methods of transportation is contraindicated by the individual's condition; prosthetic devices (other than dental) that replace all or part of an internal organ, including replacement of such devices; leg, arm, back, and neck braces, and artificial legs, arms, eyes, including replacement if required because of a change in the patient's physical condition; and 100 home health visits during a calendar year—these visits being independent of those provided under the hospital insurance program.

Eligibility

The hospital insurance program.—Almost all persons aged 65 and over are eligible for benefits under the hospital insurance program. Included are those persons in this age group who are entitled to monthly social security cash benefits or payments from the railroad retirement system, regardless of whether they have applied for these cash benefits. A person could apply for hospital insurance protection even though he did not qualify for either social security cash benefits or a railroad retirement annuity if (1) he had attained age 65 by July 1, 1966, (2) he would become 65 years of age before 1968, or (3) he would attain age 65 after 1967 with not less than 3 quarters of social security coverage, whenever acquired, for each calendar year elapsing after 1965 and before the year in which he would attain age 65; however, hospital insurance protection could not go into effect until the individual attained age 65. These three classes of individuals were "deemed insured" under a special transitional provision.

Federal employees who retired from the Federal service after July 1, 1960, and who had the opportunity to be covered under the Federal Employees Health Benefits Act of 1959, are ineligible for hospital insurance benefits under the transitional provisions. Also ineligible are aliens with less than 5 years of continuous residence in the United States, and those persons convicted of crimes against the security of the United States.

Hospital insurance protection can be retoractive for as many as 12 months before the month an individual files his application for entitlement. For example, an individual may apply 11 months after he attains age 65 and still be entitled to benefits from the month he attained age 65.

Supplementary medical insurance.—Persons entitled to benefits under the hospital insurance program (Part A), retired Federal employees aged 65 or over, and persons not eligible for hospital insurance under the transitional provisions may voluntarily participate in the SMI program.

Enrollment.—An eligible person may enroll during the initial enrollment period, which begins with the third month preceding the one in which an individual attains age 65 and ends 3 months after the month of attainment, a total period of 7 months. If he enrolls during the 3 months prior to the month in which he attains age 65, his coverage is effective with the month in which he attains age 65: if he enrolls during the month he attains age 65, his coverage begins the following month; if he enrolls in any of the 3 months

after he attains age 65, his coverage begins from 2 to 3 months after enrollment, depending on how long he waited before enrolling.

A general enrollment period was set between October 1, 1967, and March 31, 1968, for those who did not enroll in the regular enrollment period, with comparable periods set to occur in every odd-numbered year from October through December. A person who enrolls during a general enrollment period may receive benefits starting on the first of July following the general enrollment period. An eligible individual must enroll within 3 years after the close of the first enrollment period in which he was entitled to enroll in order to become a beneficiary.

An initial general enrollment period was set up at the beginning of the program for people who had attained age 65 before March 1, 1966. This enrollment period began September 1, 1965, and ended on May 31, 1966, for coverage to begin with the initiation of the program on July 1, 1966.

A State may enroll otherwise eligible individuals who receive cash payments under public assistance programs if the State requests such a State-Federal enrollment agreement to be established and pays the necessary premiums.

Enrollment terminates with the beginning of the month following the month of death. In general, railroad retirement beneficiaries and individuals entitled to monthly cash social security benefits may terminate their enrollment voluntarily by notifying the Social Security Administration in writing during a general enrollment period of the desire to withdraw from the program. Other enrolled persons may terminate their coverage by withholding payment of premiums or by notifying the Social Security Administration in writing of the desire to withdraw from the program. An individual who previously has terminated his enrollment may re-enroll only in a general enrollment period beginning within 3 years of the date his previous enrollment had terminated. Re-enrollment, however, is allowed only once.

Financing the Program

Hospital Insurance.—The hospital insurance program is financed on a long-range, self-supporting basis through a separate schedule of increasing tax rates on the first \$6,600 of earnings in employment covered under the Social Security Act with the same rate for employees, employers, and self-employed persons. The earnings base was raised in 1968 to \$7,800. This rate was 0.35 percent in 1966, 0.50 percent for 1967, and is scheduled to increase until it is 0.90 percent in 1987 and thereafter. The proceeds of this tax and that collected from the railroad retirement system are placed in a Hospital Insurance Trust Fund¹ from which reimbursements for all benefits and administrative expenses incurred under the hospital in-

surance program are paid. The Hospital Insurance Trust Fund is reimbursed from general tax revenues for the costs of providing coverage for the almost 2½ million persons who qualify for hospital insurance but who are not entitled to monthly social security or railroad retirement benefits, that is, those "deemed insured."

Supplementary Medical Insurance. Premiums are paid into the Federal Supplementary Medical Insurance Trust Fund² by those persons enrolled for supplementary medical insurance, (or on their behalf) and a matching amount is paid from general revenues by the Federal Government.

The premiums of persons receiving social security cash benefits, railroad retirement, or Federal civil service annuities are deducted from their monthly benefit checks. Persons not receiving monthly benefits are billed quarterly for premiums by the Social Security Administration or Railroad Retirement Board and have a 90-day grace period in which to make payment. Premiums may be paid for as long as a year in advance, and for individuals financially unable to make quarterly payments, arrangements can be made for monthly payments.

The premium rate of the supplementary medical insurance program may be adjusted annually if medical costs rise. The law requires that the rate be set at an amount that will generate income to the fund sufficient to cover benefit payments and administrative costs incurred during the year. The monthly premium was set at \$3 beginning with July 1966 and remained at this level until April 1968 when it was raised to \$4 per month.

States are permitted to enter into agreements with the Secretary, based on a request made before January 1, 1970, to buy in—that is, to pay the medical insurance premiums—for public assistance recipients aged 65 or over who were receiving money payments under an approved public assistance plan and for all aged persons eligible to receive medical assistance under an approved Title XIX plan.

Administration of the Program

Hospital Insurance.—Under the hospital insurance plan, groups or associations of providers, on behalf of their members, may nominate a national, State, or other public or private agency or organization to serve as intermediary in the claims process. A member of an association is free, however, to receive payment from an approved intermediary other than its association's nominee, if approved by the Secretary and agreeable to the intermediary selected. In addition, a provider may deal directly with the Social Security Administration.

¹1967 Annual Report of the Board of Trustees of the Federal Hospital Insurance Trust Fund, U.S. House of Representatives Document Number 64.

² The 1967 Annual Report of the Board of Trustees of the Federal Supplementary Medical Insurance Trust Fund, U.S. House of Representatives Document Number 66.

The Secretary may enter into an agreement with a nominated organization if he finds this to be consistent with effective and efficient administration of the hospital insurance program. The intermediary makes payments to providers for covered items and services on the basis of reasonable cost determinations and assists in the application of safeguards against unnecessary utilization of covered services. The agreement may also call for (1) furnishing consultative services to assist providers to establish and maintain necessary fiscal records and otherwise qualify as providers of services, (2) serving as a center for communicating with providers, and (3) making audits of provider records. Generally speaking, the Social Security Administration utilizes the services of the hospital insurance intermediary in making payments for home health and outpatient hospital services covered under the supplementary medical insurance program.

Payment may be made for a beneficiary for covered emergency inpatient hospital services where the hospital is not a participating facility and agrees not to charge the beneficiary for covered services. Such a hospital may be outside the United States if it is more accessible than the nearest hospital in the United States adequately equipped to treat the patient.

Requests for payment for covered services must be signed by the beneficiary (or someone for him, if he is unable to do so). Payments are made on the basis of reasonable costs for these services to participating providers of services, that is, hospitals, extended care facilities, and home health agencies, who have been certified for participation.

In some instances, hospitals may bill for physician services rendered to inpatients. In these cases, interim payment is made from the HI trust fund. Subsequently, funds are transferred from the SMI trust fund to the HI trust fund to cover the cost of these services.

The intermediary selected by the provider reviews the claims for payment and pays the provider. Actual payment is made on the basis of an interim rate established between the provider and the intermediary. Final settlement for each provider's operating year is made on the basis of a cost report submitted by the provider, and subject to an independent audit.

No payments can be made to Federal providers of services except for emergency services, unless this provider serves as a community institution. In additon, payment cannot be made to a provider for those services it is obligated to render at public expense under Federal law or contract.

Supplementary Medical Insurance.—Under the medical insurance program, the Secretary of Health, Education, and Welfare may enter into contracts with carriers for the performance of specified administrative functions. The carriers' principal function is to

determine whether charges are allowable (reasonable) and to make payments.

The carrier selected by the Secretary of Health, Education, and Welfare to serve as an intermediary determines the allowed charges for bills submitted for each medical care service covered by the program and pays 80 percent of this amount after the \$50 deductible has been met.

The allowed charge for the service may be paid to the patient, or the patient may assign the bill for collection to the physician or other supplier of the service if he is willing to accept assignment. In the former situation, the patient first pays the bill and submits the receipted bill to the carrier and is reimbursed, and, in the latter, the physician or other supplier submits the bill and is reimbursed. When the payment is made directly to the physician (or supplier) on assignment, the allowed charge determined by the carrier is the total charge. In both situations, the patient is responsible for the first \$50 of the charges for covered services he receives during the year and the amount of the bill over 80 percent of the allowed charges.

The law instructs the carrier to consider the following criteria in determining the "allowed" charge:

- (1) the customary charge for the service generally made by the physician or other person furnishing such services; and
- (2) the prevailing charge in the locality by other physicians and suppliers for similar services.

The law also specifies that the "allowed" or reasonable charge cannot be higher than the charge applicable for a similar service rendered under comparable circumstances to the carriers' own policy holders or subscribers.

Carriers also have the authority and responsibility to determine, in a given case, whether a claim is for a covered service and to deny claims for noncovered or excluded items or services. In addition, carriers are to assist in the application of safeguards against the furnishing of unnecessary services to eligible individuals.

Most services covered by the medical insurance program are rendered on a fee-for-service basis. However, services furnished under group practice prepayment plans are normally rendered in return for predetermined premium payments. In recognition of the need for special adaptation of the Medicare payment procedures for services rendered by group practice prepayment plans, the law provides that an organization which furnishes medical and other health services (or arranges for their availability) on a prepayment basis, may elect to be paid 80 percent of the reasonable cost of services in lieu of 80 percent of the allowed charge for such services.

General Tables

Notes

Short-stay hospital: General and special hospitals certified as participating facilities under Medicare and reporting average stays of less than 30 days.

Personal characteristics:

Age: Completed years at last birthday in month of admission to hospital.

Race: White, all other races, or race unknown as entered into the Health Insurance Entitlement (HIE) master file from basic records completed by the primary beneficiary. Race unknown, whether or not specifically indicated in a table, is included in the "all persons" or equivalent totals.

Sex: As designated in the HIE master file.

Geographic classifications: Based on the address to which the enrollee's cash benefit check is being mailed or the mailing address recorded in the HIE master file at the time the bill is processed by the Social Security Administration regardless of the reference date of the table.

All areas: Consists of the United States, Guam, Puerto Rico, Virgin Islands, other outlying areas, and foreign countries.

United States: Consists of the 50 States, the District of Columbia, and residence unknown.

Other outlying areas: Consists of American Samoa, the Canal Zone, Canton Island, Caroline Island, Mariana Islands, Marshall Islands, Midway Islands, and Wake Island.

SMSA: Standard metropolitan statistical area as classified by the Bureau of the Budget.¹ Except in New England, each SMSA includes a county that contains a central city of at least 50,000 inhabitants. In addition, contiguous counties are included in the SMSA if they meet certain criteria of economic and social integration with the central city. In New England, an SMSA consists of towns and cities, rather than counties. However, the mailing address of beneficiaries in the Health Insurance Eligibility file is coded only for State and county. Therefore, for New England, the SMSA was replaced by the metropolitan State economic area (SEA), which is defined in terms of whole counties.

Hospital control:

Voluntary-church: Hospitals whose governing authority is a non-profit religious organization. For "Catholic" hospitals, this organization can be either a national or international nursing order, or the local ecclesiastical authority, i.e., the local bishop.

Voluntary-other: Hospitals whose governing authority is a nonprofit organization other than a religious one.

Proprietary: Hospitals whose governing authority is an individual, partnership, or profit-making corporation.

Government: Hospitals whose governing authority is a unit of government. The unit may be a State, county, or city, or a city and county government jointly, or a hospital district established by a State agency. Federal hospitals are excluded by law from unqualified participation in the program. Except under special circumstances, they are authorized only to furnish emergency services.

Hospital affiliation and accreditation:

Accreditation by JCAH: The Joint Commission on Accreditation of Hospitals (JCAH) evaluates hospitals for conformance to standards of accreditation. The Medicare law provides that accreditation by the Joint Commission was deemed equivalent to meeting all conditions for participation other than Title VI requirements relating to equal right and statutory requirements for utilization review.

Affiliation with a medical school: A number of licensed medical schools maintain and staff component hospitals to provide the full complement of clinic training. In addition, other major hospitals have established affiliation agreements with medical schools where the hospitals have been selected by medical schools to serve as "major units" in the schools teaching programs. These two categories of hospitals are characterized as "affiliated."

Nonaffiliated, approved intern program: Includes nonaffiliated hospitals with intern programs approved by any one of the following: American Medical Association, American Dental Association, or the American Osteopathic Association.

Continued inside back cover.
